

AMENDMENTS TO THE CLAIMS

Pursuant to 37 C.F.R. § 1.121 the following listing of claims will replace all prior versions, and listings, of claims in the application.

1. (Currently Amended) An electronic apparatus for displaying a display signal included in a file, the electronic apparatus comprising:
 - a display panel;
 - a display signal acquisition unit operable to obtain the display signal from the file;
 - an image information acquisition unit operable to obtain image information from the file, said image information including information regarding an attribute of the display signal;
 - a lighting unit operable to light said display panel;
 - a parameter unit operable to generate a parameter based on the image information in combination with a light state of said lighting unit, and operable to output the generated parameter;
 - a signal correcting unit operable to correct the display signal using the generated parameter and operable to output the corrected display signal; and
 - a driving unit operable to drive said display panel based on the corrected display signal.
2. (Original) The electronic apparatus as set forth in claim 1, wherein said parameter includes information used for tone reproduction curve correction.
3. (Previously Presented) An electronic apparatus comprising:
 - a display panel;

a lighting unit operable to light said display panel,

a parameter adjusting unit operable to, with a variation in a light state of said lighting unit as a trigger, adjust a parameter participating in picture quality so as to conform said light state;

wherein said parameter includes information used for tone reproduction curve correction;

wherein said parameter includes information used for tone reproduction curve correction of at least two of a halftone priority characteristic that gives priority to a middle range and a high range/low range priority characteristic that gives priority to a high range/low range;

a signal correcting unit operable to input a display signal and to correct an input display signal in accordance with an adjusted parameter;

a driving unit operable to drive said display panel on the basis of a corrected display signal;

and

an image information acquisition unit operable to acquire image information about a display signal, wherein:

if acquired image information shows that the display signal includes a great amount of middle ranges, the signal correcting unit makes tone reproduction curve correction according to the halftone priority characteristic; and

if acquired image information shows that the display signal includes a great amount of high ranges/low ranges, the signal correcting unit makes tone reproduction curve correction according to the high range/low range priority characteristic.

6. (Original) The electronic apparatus as set forth in Claim 1, wherein said parameter includes information about one or more of edge enhancement processing, hue adjustment, color gain adjustment, and white balance adjustment.
7. (Previously Presented) The electronic apparatus as set forth in Claim 1, further comprising an area used to store profile information about a device that has generated said display signal, wherein said signal correcting unit corrects said display signal while taking this profile into account.
8. (Previously Presented) The electronic apparatus as set forth in Claim 1, further comprising an operating unit that accepts operation of a user, and a control unit operable to input operational information from said operating unit, wherein
when operational information is not input continuously during a fixed time, said control unit turns off said lighting unit, and, with this turn-off as a trigger, causes said parameter adjusting unit to adjust said parameter participating in picture quality so as to conform a light state.
9. (Currently Amended) A recording medium recording a program, the program controlling an electronic apparatus for displaying a display signal included in a file, the electronic apparatus including a display panel, a lighting unit operable to light the display panel, and a driving unit operable to drive the display panel, the program comprising:
